PROFESSIONAL SUMMARY

Java Full Stack Developer with 7 years of experience designing and developing scalable microservices and cloud-native applications using Java 8/11/17/21, Spring Boot, REST APIs, Kafka, and Angular across banking, healthcare, and telecom domains. Strong expertise in AWS, Docker, Kubernetes, CI/CD pipelines using Jenkins and GitHub Actions, and relational databases including PostgreSQL, Oracle, and MySQL with Hibernate/JPA. Experienced in application security using Spring Security, OAuth2, and JWT, along with automated testing using JUnit and Mockito, API design, performance optimization, and production troubleshooting. Skilled in Agile development, code reviews, application modernization, and leveraging GitHub Copilot to improve code quality and development efficiency.

SKILLS

Core Java & JVM: Java 8/11/17/ 21, OOP, Collections, Streams, Exception Handling, JVM Internals, Multithreading, Functional Programming, Reactive Programming

Backend Frameworks: Spring Boot, Spring Security, Spring Data JPA, Hibernate, RESTful API Design, API Gateway, Microservices Architecture, Circuit Breaker Pattern, Transaction Management

Frontend Frameworks & UI: Angular, RxJS, Component-based Design, Routing, State Management, UI Performance Optimization, JWT, OAuth2, Role-based Access Control

Cloud & DevOps: AWS EC2, EKS, AWS S3, AWS RDS, AWS Lambda, API Gateway, SNS, SQS, IAM, ECS, Azure, AKS, AutoScaling, CloudWatch, Docker, Kubernetes, OpenShift, Jenkins, GitHub Actions, CI/CD pipelines, Helm, Maven, Gradle

Databases & ORM: MySQL, PostgreSQL, Oracle DB, JPA, Hibernate, SQL, Distributed Transactions, Query Optimization, Transaction Management, Redis, Apache Cassandra, SQL Server, MongoDB

Testing & QA: JUnit, Mockito, Automation, Integration Testing, CI/CD Test Integration, Regression Testing, Postman, JMeter, Jasmine, Karma

Messaging & Streaming: Kafka, Producers/Consumers, Topic Design, Consumer Groups, Event Streaming, Error Handling, Performance Tuning, RabbitMQ

API & Integration: REST APIs, Third-party API Integration, API Specification, OpenAPI/Swagger, Authentication, Authorization, Versioning, Contract-First Design, OpenID Connect

Architecture & Design Patterns: Microservices Architecture, Service Decomposition, Resiliency Patterns, Domain-Driven Design, Modular Architecture, Event-Driven Architecture, Circuit Breaker Pattern

Productivity & Collaboration: Git, GitHub, GitHub Copilot, Code Generation, Code Quality Improvements, Agile Delivery, Stakeholder Communication, Problem Solving, Ownership, Collaboration

Code Quality & Migration: OpenRewrite, SonarQube, Synk, Splunk, Prometheus, Grafana, Spring Boot Actuator

WORK EXPERIENCE

Master Card | Java Full Stack Developer | Saint Louis, Missouri Jul 2024 - Present

Working as a Java Full Stack Developer at Mastercard, designing and developing secure, scalable microservices and REST APIs for financial transaction processing and settlement using Java 17/21, Spring Boot, Kafka, and PostgreSQL. Responsible for implementing event-driven architecture, optimizing database performance, and deploying containerized applications on AWS EKS/ECS. Involved in Java 21 application modernization, CI/CD automation using Jenkins, SonarQube, and Snyk, along with automated testing, security enhancements, code reviews, and production support using CloudWatch and Splunk.

- Designed and developed scalable microservices using Java 17/21, Spring Boot, and Spring MVC to process high-volume financial transactions and payment-related business workflows.
- Built secure RESTful APIs with Spring Boot and Spring Security (JWT + OAuth2), implementing request validation, exception handling, and role-based access control for sensitive financial data.
- Integrated Hibernate/JPA with PostgreSQL to manage transactional data, optimize complex queries, and ensure data consistency across payment and settlement modules.

- Implemented event-driven architecture using Kafka producers and consumers for real-time processing of transaction events, status updates, and error handling to improve system responsiveness and fault tolerance.
- Deployed and supported containerized microservices on AWS using Amazon EKS and ECS, integrating Amazon RDS (PostgreSQL), Apache Cassandra, S3, and Lambda to support scalable transaction processing, distributed data storage, and event-driven workflows.
- Supported the migration of selected legacy Java modules and REST APIs to Java 21 and compatible Spring Boot versions, leveraging OpenRewrite to automate code transformations and dependency upgrades, resolving compatibility issues, and performing regression testing to ensure application stability and API backward compatibility.
- Worked on JIRA stories in bi-weekly Agile sprints, participating in daily stand-ups, sprint planning, backlog refinement, and retrospectives.
- Followed standard Git workflow by creating feature branches, raising pull requests, resolving merge conflicts, and completing multi-step PR reviews (code review, SonarQube quality gate, unit tests, and peer approval).
- Configured and maintained Jenkins multi-stage CI/CD pipelines (build → unit tests → SonarQube analysis → Snyk scan → Docker packaging → deployment) to ensure consistent and secure releases.
- Used SonarQube for static code analysis to identify bugs, code smells, and security hotspots; remediated findings before production deployment.
- Scanned applications with Snyk to detect vulnerable dependencies and exposed credentials; upgraded libraries, rotated secrets, and validated fixes.
- Created unit and integration tests using JUnit and Mockito; performed API testing with Postman; conducted functional and load testing using JMeter.
- Monitored applications using AWS CloudWatch and Splunk; investigated production issues through log analysis, performed root-cause analysis, applied fixes, and validated resolutions.
- Raised and tracked ServiceNow change tickets for production deployments, including risk assessment, approvals, and rollback planning.
- Leveraged GitHub Copilot for code generation, refactoring, and unit-test creation while always reviewing, debugging, and validating AI-generated code before committing.
- Supported dependency and framework upgrades, ensuring compatibility and running regression tests prior to release.

Spectrum | Java Full Stack Developer | Saint Louis, Missouri May 2023 - Jan 2024

Worked as a Java Full Stack Developer at Spectrum, developing cloud-native telecom customer service and operations applications using Java, Spring Boot microservices, Angular 14, and REST APIs. Responsible for building customer service, billing, and reporting functionalities, optimizing PostgreSQL and MongoDB operations, and implementing Redis caching for improved performance. Contributed to microservices modernization, API security using Spring Security and Azure AD, and deployments on Azure Kubernetes Service (AKS) using Docker and Helm. Involved in CI/CD automation with Azure DevOps, automated testing, performance monitoring using Prometheus and Grafana, and production support.

- Developed and enhanced a cloud-native Telecom Customer Service & Operations Platform using Java, Spring Boot microservices, and Angular 14 on Microsoft Azure, supporting customer service information, billing-related records, and service performance monitoring.
- Designed and developed Spring Boot REST APIs for three core business functionalities: customer service case management, billing history retrieval, and service performance reporting, enabling efficient data access for customer support and operations teams.
- Integrated Angular 14 with Spring Boot REST APIs to develop interactive dashboards displaying customer support information, billing summaries, and service performance metrics, improving data accessibility and operational visibility.
- Developed and optimized PostgreSQL queries for customer billing records and historical service performance data, implementing indexing and table partitioning strategies to improve query efficiency and reporting performance.

- Integrated MongoDB for storing flexible customer service information, including support cases, customer interactions, and service-related records, while supporting data synchronization with PostgreSQL for consistent information retrieval across application components.
- Integrated Redis caching with Spring Boot microservices to optimize frequently accessed customer service reference data, billing summaries, and service performance information, reducing repeated PostgreSQL queries and improving API responsiveness.
- Contributed to migrating legacy monolithic components related to customer service, billing, and service performance into independently deployable Spring Boot microservices, improving modularity, maintainability, and independent scaling.
- Implemented secure API access using Spring Security, OpenID Connect, and Azure Active Directory, enabling centralized authentication and role-based authorization for customer service representatives and operations users.
- Developed and executed unit and regression tests for backend APIs and Angular 14 components, using Jasmine and Karma for frontend testing to validate customer service workflows, billing data presentation, and dashboard functionality.
- Containerized Spring Boot microservices using Docker and supported deployments to Azure Kubernetes Service (AKS), developing Helm charts for standardized application configuration, scaling, and rollback capabilities.
- Automated build, testing, and deployment workflows using Azure DevOps pipelines and Gradle, supporting consistent application releases across development, testing, and production environments.
- Implemented application monitoring and performance optimization using Spring Boot Actuator, Prometheus, and Grafana, tracking API response times, JVM memory utilization, error rates, and application health to identify performance bottlenecks and improve microservices reliability.
- Collaborated with backend developers, frontend engineers, DevOps teams, and other engineering squads in an Agile Scrum environment to deliver enhancements, resolve production issues, and maintain application stability.

United Health Group | Java Developer | Hyderabad, India Apr 2021 - Jul 2022

Worked as a Java Developer at UnitedHealth Group, developing secure and scalable healthcare claims processing applications using Java 11, Spring Boot, REST APIs, and microservices architecture. Responsible for backend development, database optimization using SQL Server and MongoDB, and asynchronous messaging integration with RabbitMQ. Implemented application security using Spring Security and SAML SSO, along with automated testing using JUnit and Mockito. Involved in CI/CD automation with Jenkins and Maven, containerized deployments using Docker and OpenShift, performance tuning, and production support in HIPAA-compliant environments.

- Developed backend services using Java 11 and Spring Boot for healthcare claims processing applications supporting secure data exchange with providers and insurance databases using REST API standards.
- Implemented microservices leveraging Spring Cloud Gateway and Eureka enabling dynamic routing and service resilience for enterprise healthcare management platforms handling millions of patient records.
- Designed SQL Server database schemas and wrote stored procedures optimizing data transactions related to electronic health record management for faster claims approvals and audits.
- Utilized MongoDB as a NoSQL data store for unstructured patient data to facilitate quick lookups and improved scalability in distributed healthcare applications.
- Configured CI/CD pipelines in Jenkins with Maven build automation to accelerate release cadence and integrated automated testing ensuring production quality in compliance with HIPAA regulations.
- Containerized microservices with Docker and deployed on OpenShift clusters improving portability across development, testing, and production environments with minimal configuration overhead.
- Implemented role-based security using Spring Security integrated with SAML for enterprise single sign-on across multiple healthcare portals ensuring compliance with data privacy policies.
- Wrote JUnit and Mockito tests for backend services to verify business logic accuracy and reliability in insurance claim adjudication systems during iterative development cycles.
- Participated actively in Agile SCRUM ceremonies collaborating with remote product owners, QA engineers, and UX teams to refine requirements and deliver incremental product enhancements.

- Optimized backend performance by profiling JVM and tuning Hibernate caches to handle high concurrency scenarios involving large-scale claims processing workflows.
- Spearheaded integration of RabbitMQ messaging queues for asynchronous communication between billing and claims subsystems enhancing system responsiveness and fault tolerance.
- Delivered specialized reporting modules enabling real-time analytics on patient claims and provider performance supporting strategic decision-making at the executive level.

Deloitte | Software Engineer | Hyderabad, India Jan 2019 - Apr 2021

Worked as a Software Engineer at Deloitte, developing and maintaining Java 8 and Spring Boot applications for Bank of America's internal audit and risk management platform. Responsible for building secure REST APIs, optimizing Oracle SQL queries and stored procedures, and implementing authentication and authorization using Spring Security, JWT, and OAuth2. Used Redis caching to improve application performance and supported deployments on AWS EC2 and S3 using Docker, Jenkins, and Maven. Involved in automated testing with JUnit and Mockito, CI/CD processes, production troubleshooting using Splunk and CloudWatch, and Agile development practices.

- Developed and enhanced Java 8 and Spring Boot applications supporting Bank of America’s internal audit and risk tolerance processes, including migration of legacy modules to a modular structure.
- Built RESTful APIs using Spring Boot to enable secure data exchange between audit systems and other internal platforms, handling request validation and basic error handling.
- Designed and optimized Oracle database queries and simple stored procedures to support regulatory reporting, audit evidence storage, and transaction review requirements.
- Implemented JWT and basic OAuth2 security on APIs to control access to sensitive audit and compliance data according to enterprise standards.
- Created unit and integration tests using JUnit and Mockito to improve reliability of audit-related services before releases.
- Used Redis for caching frequently accessed reference data (such as risk ratings and control libraries) to improve response times and reduce database load.
- Deployed and supported applications on AWS using EC2 instances and S3 for storing audit reports, evidence files, and static content.
- Configured basic monitoring and logging with AWS CloudWatch to track application health and troubleshoot issues in non-production and production environments.
- Containerized applications with Docker and supported Jenkins + Maven CI/CD pipelines for consistent builds and deployments across environments.
- Participated in Agile ceremonies (daily stand-ups, sprint planning, and retrospectives) and collaborated with onshore and offshore teams to deliver features on schedule.
- Supported production deployments and application troubleshooting using Splunk, analyzing Java exception logs, REST API failures, and application errors to identify issues and assist with incident resolution.

EDUCATION

Kamala Institute of Technology and Science Aug 2016 - May 2019
Bachelor's, *Computer Science and Engineering* GPA: 7.5

Webster University Aug 2022 - May 2024
Master's, *Information Technology Management* GPA: 3.95

CERTIFICATIONS & ACHIEVEMENTS

- AWS Solutions Architect - Associate - Amazon Web Services
